

### Features

- ESD Protect for 2 Lines with Unidirectional
- ESD Protect for 1 Line with Bidirectional
- Provide ESD protection for each line to IEC 61000-4-2 (ESD) ±30kV (air), ±22kV (contact) IEC 61000-4-4 (EFT) 80A (5/50ns)
   IEC 61000-4-5 (Lightning) 16A(8/20µs)
- For low operating voltage applications: 5V, 4.2V, 3.3V, 2.5V
- Fast turn-on and Low clamping voltage
- Array of surge rated equivalent TVS diodes
- Small package saves board space
- Solid-state silicon-avalanche and active circuit triggering technology

# Applications

- Notebooks, Desktops, Servers
- Hand Held Portable Applications
- Serial and Parallel Ports
- Power Lines and Low Speed Data Lines of Electronic Systems.

# Description

AZ2015-02S is a design which includes surge rated clamping cell arrays to protect the power lines or control lines in an electronic systems. The AZ2015-02S has been specifically designed to protect sensitive components which are connected to power and control lines from over-voltage caused by Electrostatic Discharging (ESD), Electrical Fast Transients (EFT), and Lightning.

AZ2015-02S is a unique design which includes proprietary clamping cells in a single package. During transient conditions, the proprietary clamping cells prevent over-voltage on the power lines or control lines, protecting any downstream components.

AZ2015-02S may be used to meet the ESD immunity requirements of IEC 61000-4-2, Level 4 ( $\pm$ 15kV air,  $\pm$ 8kV contact discharge).

### **Typical Characteristics**

## **Applications Information**

The AZ2015-02S is designed to protect two lines against System ESD/EFT/Lightning pulses by clamping them to an acceptable reference.

The usage of the AZ2015-02S is shown in Fig. 1. Protected lines, such as data lines, control lines, or power lines, are connected at pin 1 and 2. The pin 3 should be connected directly to a ground plane on the board. All path lengths connected to the pins of AZ2015-02S should be kept as short as possible to minimize parasitic inductance in the board traces. In order to obtain enough suppression of ESD induced transient, good circuit board is critical. Thus, the following guidelines are recommended:

- Minimize the path length between the protected lines and the AZ2015-02S.
- Place the AZ2015-02S near the input terminals or connectors to restrict transient coupling.
- The ESD current return path to ground should be kept as short as possible.
- Use ground planes whenever possible.
- NEVER route critical signals near board edges and near the lines which the ESD transient easily injects to.

Fig. 2 shows another simplified example of using AZ2015-02S to protect the control lines, low speed data lines, and power lines from ESD transient stress.

Fig. 3 shows the simplified example of using AZ2015-02S to provide a bidirectional protection on a data line from ESD transient stress.
